

Cubature and splitting schemes for stochastic differential equations

Christian Bayer (joint work with P. Friz, R. Loeffen and J. Teichmann)

University of Vienna

January 9, 2012

TU München

Outline

- 1 Introduction
- 2 Cubature and splitting schemes
 - Cubature on Wiener space
 - Stochastic splitting schemes
- 3 Semi-closed form cubature
 - The Ninomiya-Victoir method
 - Solutions of ODEs
 - Example: Generalized SABR model
 - Further examples

Weak approximation of solutions of SDEs

$$dX_t = V_0(X_t)dt + \sum_{i=1}^d V_i(X_t) \circ dB_t^i =: \sum_{i=0}^d V_i(X_t) \circ dB_t^i, \quad (1)$$

- ▶ $V_0, \dots, V_d : \mathbb{R}^N \rightarrow \mathbb{R}^N$ vector fields
- ▶ B_t a d -dimensional Brownian motion, $B_t^0 := t$

Problem

For $f : \mathbb{R}^N \rightarrow \mathbb{R}$ sufficiently regular, compute
 $u(t, x) := E[f(X_T) | X_t = x]$.

PDE formulation

$\partial_t u + Lu = 0$, where $Lf(x) = V_0 f(x) + \frac{1}{2} \sum_{j=1}^d V_j^2 f(x)$,
 $V_j f(x) := V_j(x) \cdot \nabla f(x)$.

Different approaches

PDE methods: Solve the (linear, second order, parabolic) PDE directly, using finite elements, finite differences, . . .

Probabilistic methods: Solve the SDE and integrate.

- ▶ Discretize SDE to find an approximate solution $\bar{X}_T^{(n)}$.
- ▶ Integrate $E \left[f \left(\bar{X}_T^{(n)} \right) \right]$ using (quasi) Monte-Carlo simulation.

Splitting methods: Use structure $L = V_0 + \frac{1}{2} \sum_{j=1}^d V_j^2 = \sum_{i=0}^d L_i$.

- ▶ Solve the PDEs for L_i and combine solutions.
- ▶ Probabilistic splitting schemes.

We only consider the probabilistic methods in this talk, with the aim of obtaining higher order methods.

Different approaches

PDE methods: Solve the (linear, second order, parabolic) PDE directly, using finite elements, finite differences, . . .

Probabilistic methods: Solve the SDE and integrate.

- ▶ **Discretize** SDE to find an approximate solution $\bar{X}_T^{(n)}$.
- ▶ **Integrate** $E \left[f \left(\bar{X}_T^{(n)} \right) \right]$ using (quasi) Monte-Carlo simulation.

Splitting methods: Use structure $L = V_0 + \frac{1}{2} \sum_{j=1}^d V_j^2 = \sum_{i=0}^d L_i$.

- ▶ Solve the PDEs for L_i and combine solutions.
- ▶ Probabilistic splitting schemes.

We only consider the probabilistic methods in this talk, with the aim of obtaining higher order methods.

Euler discretization of SDEs

- ▶ SDE: $dX_t = \sum_{i=0}^d V_i(X_t) \circ dB_t^i$
- ▶ Naive Euler discretization:

$$\bar{X}_{t_{j+1}}^{(n)} = \bar{X}_{t_j}^{(n)} + V_0(\bar{X}_{t_j}^{(n)})\Delta t_j + \sum_{i=1}^d V_i(\bar{X}_{t_j}^{(n)})\Delta B_j^i$$
- ▶ Scaling property of Brownian increments:

$$\Delta B_j^i \sim \mathcal{N}(0, \Delta t_j) \approx \sqrt{\Delta t_j}, (\Delta B_j^i)^2 \approx \Delta t_j$$
- ▶ Correct Euler discretization:

$$\bar{X}_{t_{j+1}} = \bar{X}_{t_j} + V(\bar{X}_{t_j}^{(n)})\Delta t_j + \sum_{i=1}^d V_i(\bar{X}_{t_j}^{(n)})\Delta B_j^i, \text{ with}$$

$$V(x) = V_0(x) + \frac{1}{2} \sum_{i=1}^d DV_i(x) \cdot V_i(x)$$

Complications compared to discretization of ODEs

- ▶ Higher order terms relevant
- ▶ “May not look into future.”

Euler discretization of SDEs

- ▶ SDE: $dX_t = \sum_{i=0}^d V_i(X_t) \circ dB_t^i$
- ▶ Naive Euler discretization:

$$\bar{X}_{t_{j+1}}^{(n)} = \bar{X}_{t_j}^{(n)} + V_0(\bar{X}_{t_j}^{(n)})\Delta t_j + \sum_{i=1}^d V_i(\bar{X}_{t_j}^{(n)})\Delta B_j^i$$
- ▶ Scaling property of Brownian increments:

$$\Delta B_j^i \sim \mathcal{N}(0, \Delta t_j) \approx \sqrt{\Delta t_j}, (\Delta B_j^i)^2 \approx \Delta t_j$$
- ▶ Correct Euler discretization:

$$\bar{X}_{t_{j+1}} = \bar{X}_{t_j} + V(\bar{X}_{t_j}^{(n)})\Delta t_j + \sum_{i=1}^d V_i(\bar{X}_{t_j}^{(n)})\Delta B_j^i, \text{ with}$$

$$V(x) = V_0(x) + \frac{1}{2} \sum_{i=1}^d DV_i(x) \cdot V_i(x)$$

Complications compared to discretization of ODEs

- ▶ Higher order terms relevant
- ▶ “May not look into future.”

Euler discretization of SDEs

- ▶ SDE: $dX_t = \sum_{i=0}^d V_i(X_t) \circ dB_t^i$
- ▶ Naive Euler discretization:

$$\bar{X}_{t_{j+1}}^{(n)} = \bar{X}_{t_j}^{(n)} + V_0(\bar{X}_{t_j}^{(n)})\Delta t_j + \sum_{i=1}^d V_i(\bar{X}_{t_j}^{(n)})\Delta B_j^i$$
- ▶ Scaling property of Brownian increments:

$$\Delta B_j^i \sim \mathcal{N}(0, \Delta t_j) \approx \sqrt{\Delta t_j}, (\Delta B_j^i)^2 \approx \Delta t_j$$
- ▶ Correct Euler discretization:

$$\bar{X}_{t_{j+1}} = \bar{X}_{t_j} + \mathbf{V}(\bar{X}_{t_j}^{(n)})\Delta t_j + \sum_{i=1}^d V_i(\bar{X}_{t_j}^{(n)})\Delta B_j^i, \text{ with}$$

$$V(x) = V_0(x) + \frac{1}{2} \sum_{i=1}^d DV_i(x) \cdot V_i(x)$$

Complications compared to discretization of ODEs

$$V(x) = V_0(x) + \frac{1}{2} \sum_{i=1}^d DV_i(x) \cdot V_i(x)$$

Complications compared to discretization of ODEs

- ▶ Higher order terms relevant
- ▶ “May not look into future.”

Integration step

- ▶ $\bar{X}_T^{(n)} = \bar{X}_T^{(n)}(\Delta B_1, \dots, \Delta B_n)$.
- ▶ Monte Carlo simulation: $\Delta B^{(l)}$ indep. realizations of ΔB ,

$$E \left[f \left(\bar{X}_T^{(n)} \right) \right] \approx \frac{1}{M} \sum_{l=1}^M f \left(\bar{X}_T^{(n)} \left(\Delta B_1^{(l)}, \dots, \Delta B_n^{(l)} \right) \right)$$

- ▶ Integration error stochastic, but of order $1/\sqrt{M}$, independent of the dimension $n \times d$
- ▶ Quasi Monte Carlo simulation: take deterministic vectors $\Delta B^{(l)}$ with special “uniformity” properties
- ▶ Integration error of order $1/M$ when dimensions not too high.
- ▶ Decomposition of error into discretization error and **integration error**.

Integration step

- ▶ $\bar{X}_T^{(n)} = \bar{X}_T^{(n)}(\Delta B_1, \dots, \Delta B_n)$.
- ▶ Monte Carlo simulation: $\Delta B^{(l)}$ indep. realizations of ΔB ,

$$E \left[f \left(\bar{X}_T^{(n)} \right) \right] \approx \frac{1}{M} \sum_{l=1}^M f \left(\bar{X}_T^{(n)} \left(\Delta B_1^{(l)}, \dots, \Delta B_n^{(l)} \right) \right)$$

- ▶ Integration error stochastic, but of order $1/\sqrt{M}$, independent of the dimension $n \times d$
- ▶ Quasi Monte Carlo simulation: take **deterministic** vectors $\Delta B^{(l)}$ with special “uniformity” properties
- ▶ Integration error of order $1/M$ when dimensions not too high.
- ▶ Decomposition of error into discretization error and **integration error**.

Integration step

- ▶ $\bar{X}_T^{(n)} = \bar{X}_T^{(n)}(\Delta B_1, \dots, \Delta B_n)$.
- ▶ Monte Carlo simulation: $\Delta B^{(l)}$ indep. realizations of ΔB ,

$$E \left[f \left(\bar{X}_T^{(n)} \right) \right] \approx \frac{1}{M} \sum_{l=1}^M f \left(\bar{X}_T^{(n)} \left(\Delta B_1^{(l)}, \dots, \Delta B_n^{(l)} \right) \right)$$

- ▶ Integration error stochastic, but of order $1/\sqrt{M}$, independent of the dimension $n \times d$
- ▶ Quasi Monte Carlo simulation: take deterministic vectors $\Delta B^{(l)}$ with special “uniformity” properties
- ▶ Integration error of order $1/M$ when dimensions not too high.
- ▶ Decomposition of error into **discretization error** and **integration error**.

Discussion of the probabilistic method

- ▶ Order of convergence of Euler scheme: n^{-1} (generically)
- ▶ Order of convergence of the (Q)MC simulation: $M^{-1/2}$, M^{-1}
- ▶ Integration error dominates.

Goal

Find higher order discretization methods.

- ▶ Reduce the dimension $n \times d$ of the integration problem, allowing to rely on quasi Monte Carlo simulation.
- ▶ Allows for extremely high precision solvers, which are not available otherwise.
- ▶ Geometric solvers.

Discussion of the probabilistic method

- ▶ Order of convergence of Euler scheme: n^{-1} (generically)
- ▶ Order of convergence of the (Q)MC simulation: $M^{-1/2}$, M^{-1}
- ▶ Integration error dominates.

Stochastic Taylor expansion

Ito formula for Stratonovich calculus

$$df(X_t) = V_0 f(X_t) dt + \sum_{i=1}^d V_i f(X_t) \circ dB_t^i = \sum_{i=0}^d V_i f(X_t) \circ dB_t^i,$$

where $V_i f(x) := V_i(x) \cdot \nabla f(x)$, $X_0 = x$.

Stochastic Taylor expansion

$$f(X_t) = f(x) + \sum_{i=0}^d \int_0^t V_i f(X_s) \circ dB_s^i,$$

Stochastic Taylor expansion

Ito formula for Stratonovich calculus

$$df(X_t) = V_0 f(X_t) dt + \sum_{i=1}^d V_i f(X_t) \circ dB_t^i = \sum_{i=0}^d V_i f(X_t) \circ dB_t^i,$$

where $V_i f(x) := V_i(x) \cdot \nabla f(x)$, $X_0 = x$.

Stochastic Taylor expansion

$$f(X_t) = f(x) + \sum_{i=0}^d \int_0^t \underbrace{V_i f(X_s)}_{= V_i f(x) + \sum_{j=0}^d \int_0^s V_j V_i f(X_u) \circ dB_u^j} \circ dB_s^i,$$

Stochastic Taylor expansion

Ito formula for Stratonovich calculus

$$df(X_t) = V_0 f(X_t) dt + \sum_{i=1}^d V_i f(X_t) \circ dB_t^i = \sum_{i=0}^d V_i f(X_t) \circ dB_t^i,$$

where $V_i f(x) := V_i(x) \cdot \nabla f(x)$, $X_0 = x$.

Stochastic Taylor expansion

$$f(X_t) = f(x) + \sum_{i=0}^d V_i f(x) B_t^i + \sum_{i,j=0}^d \int_{0 \leq u \leq s \leq t} V_j V_i f(X_u) \circ dB_u^j \circ dB_s^i,$$

Stochastic Taylor expansion

Ito formula for Stratonovich calculus

$$df(X_t) = V_0 f(X_t) dt + \sum_{i=1}^d V_i f(X_t) \circ dB_t^i = \sum_{i=0}^d V_i f(X_t) \circ dB_t^i,$$

where $V_i f(x) := V_i(x) \cdot \nabla f(x)$, $X_0 = x$.

Stochastic Taylor expansion

$$\begin{aligned} f(X_t) &= f(x) + \sum_{i=0}^d V_i f(x) B_t^i \\ &+ \sum_{i,j=0}^d \int_{0 \leq u \leq s \leq t} \underbrace{V_j V_i f(X_u)}_{= V_j V_i f(x) + \sum_{l=0}^d \int_0^u V_l V_j V_i f(X_v) \circ dB_v^l} \circ dB_u^i \circ dB_s^j, \end{aligned}$$

Stochastic Taylor expansion

Ito formula for Stratonovich calculus

$$df(X_t) = V_0 f(X_t) dt + \sum_{i=1}^d V_i f(X_t) \circ dB_t^i = \sum_{i=0}^d V_i f(X_t) \circ dB_t^i,$$

where $V_i f(x) := V_i(x) \cdot \nabla f(x)$, $X_0 = x$.

Stochastic Taylor expansion

$$\begin{aligned} f(X_t) = & f(x) + \sum_{i_1=0}^d V_{i_1} f(x) B_t^{i_1} + \sum_{i_1, i_2=0}^d V_{i_1} V_{i_2} f(x) \int_0^t B_{t_2}^{i_1} \circ dB_{t_2}^{i_2} \\ & + \sum_{i_1, i_2, i_3=0}^d \int_{0 \leq t_1 \leq t_2 \leq t_3 \leq t} V_{i_1} V_{i_2} V_{i_3} f(X_{t_1}) \circ dB_{t_1}^{i_1} \circ dB_{t_2}^{i_2} \circ dB_{t_3}^{i_3}, \end{aligned}$$

Stochastic Taylor expansion

Ito formula for Stratonovich calculus

$$df(X_t) = V_0 f(X_t) dt + \sum_{i=1}^d V_i f(X_t) \circ dB_t^i = \sum_{i=0}^d V_i f(X_t) \circ dB_t^i,$$

where $V_i f(x) := V_i(x) \cdot \nabla f(x)$, $X_0 = x$.

Stochastic Taylor expansion

$$f(X_t) = \sum_{k=0}^m \sum_{(i_1, \dots, i_k) \in \{0, \dots, d\}^k} V_{i_1} \cdots V_{i_k} f(x) B_t^{(i_1, \dots, i_k)} + R_m(t, x, f),$$

$$\sup_x \sqrt{E[R_m^2]} = O(t^{\frac{m+1}{2}}), \quad B_t^{(i_1, \dots, i_k)} := \int_{0 \leq t_1 \leq \dots \leq t_k \leq t} \circ dB_{t_1}^{i_1} \cdots \circ dB_{t_k}^{i_k}.$$

Random ODEs

- ▶ Let W be a $(d + 1)$ -dimensional process with paths of bounded variation, define $\tilde{X}_t = X(W)_t$ by the random **ODE**

$$\frac{d}{dt}\tilde{X}_t = \sum_{i=0}^d V_i(\tilde{X}_t) \dot{W}_t^i, \quad \tilde{X}_0 = x. \quad (2)$$

- ▶ Ordinary Taylor expansion:

$$f(\tilde{X}_t) = \sum_{k=0}^m \sum_{(i_1, \dots, i_k) \in \{0, \dots, d\}^k} V_{i_1} \cdots V_{i_k} f(x) W_t^{(i_1, \dots, i_k)} + \tilde{R}_m(t, x, f)$$

- ▶ Remember: Stochastic Taylor expansion

$$f(X_t) = \sum_{k=0}^m \sum_{(i_1, \dots, i_k) \in \{0, \dots, d\}^k} V_{i_1} \cdots V_{i_k} f(x) B_t^{(i_1, \dots, i_k)} + R_m(t, x, f)$$

Cubature on Wiener space

Definition

W is a **cubature formula on Wiener space** of degree m iff

$$E \left[W_t^{(i_1, \dots, i_k)} \right] = E \left[B_t^{(i_1, \dots, i_k)} \right] \text{ for } k \leq m.$$

- ▶ Cubature formulas with finite support exist (Lyons and Victoir)
- ▶ **Construction** of cubature formulas for $m > 5$ interesting open problem
- ▶ Fix a grid $0 = t_0 < t_1 < \dots < t_n = T$, define W by concatenation of independent cubature formulas (of degree m) on the sub-intervals $[t_i, t_{i+1}]$.
- ▶ Global error: $E [f(X_T)] - E \left[f(\tilde{X}_T^{(n)}) \right] = O((\max_j \Delta t_j)^{(m-1)/2})$

Cubature on Wiener space

Definition

W is a **cubature formula on Wiener space** of degree m iff

$$E \left[W_t^{(i_1, \dots, i_k)} \right] = E \left[B_t^{(i_1, \dots, i_k)} \right] \text{ for } k \leq m.$$

- ▶ Cubature formulas with finite support exist (Lyons and Victoir)
- ▶ Construction of cubature formulas for $m > 5$ interesting open problem
- ▶ Fix a grid $0 = t_0 < t_1 < \dots < t_n = T$, define W by **concatenation** of independent cubature formulas (of degree m) on the sub-intervals $[t_i, t_{i+1}]$.
- ▶ Global error: $E[f(X_T)] - E[f(\tilde{X}_T^{(n)})] = O((\max_j \Delta t_j)^{(m-1)/2})$

Extensions

- ▶ **Jump diffusions** (B. and Teichmann): add jump times to grid, but at most $m/2$ for each initial interval
- ▶ May reduce order of cubature method by two for each jump
- ▶ Backward SDEs (Crisan and Manolarakis): allows to solve semi-linear parabolic PDEs with cubature methods
- ▶ Stochastic PDEs (B. and Teichmann): expectation of an SPDE approximated by an expectation of a random PDE
- ▶ Recombination techniques (Litterer and Lyons): reduces the growth of the support of the cubature formula to polynomial growth

Extensions

- ▶ Jump diffusions (B. and Teichmann): add jump times to grid, but at most $m/2$ for each initial interval
- ▶ May reduce order of cubature method by two for each jump
- ▶ **Backward SDEs** (Crisan and Manolarakis): allows to solve semi-linear parabolic PDEs with cubature methods
- ▶ Stochastic PDEs (B. and Teichmann): expectation of an SPDE approximated by an expectation of a random PDE
- ▶ Recombination techniques (Litterer and Lyons): reduces the growth of the support of the cubature formula to polynomial growth

- ▶ Stochastic PDEs (B. and Teichmann): expectation of an SPDE approximated by an expectation of a random PDE
- ▶ **Recombination techniques** (Litterer and Lyons): reduces the growth of the support of the cubature formula to polynomial growth

Abstract splitting

$$E[f(X_t)|X_0 = x] =: P_t f(x) = \exp\left(t\left(V_0 + \frac{1}{2} \sum_{i=1}^d V_i^2\right)\right) f(x)$$

- ▶ General splitting: $V_0 + \frac{1}{2} \sum_{i=1}^d V_i^2 = \sum_{i=0}^d U_i$, then approximate $P_t \approx \prod_j e^{t\gamma_j U_{i(j)}}$
- ▶ Maximal order of convergence: 2 for positive weights γ

Example

- ▶ $Q_t = e^{tU_0} \dots e^{tU_d}$, $Q_t^* = e^{tU_d} \dots e^{tU_0}$ (Lie-Trotter splitting or symplectic Euler method)
- ▶ $Q_t = \frac{1}{2}(e^{tU_0} \dots e^{tU_d} + e^{tU_d} \dots e^{tU_0})$ (symmetrically weighted sequential splitting)

Stochastic splitting

- ▶ For a splitting scheme: $e^{\frac{\gamma}{2} V_i^2} f(x) = E[f(Y_\gamma)]$, with

$$dY_t = V_i(Y_t) \circ dB_t^i, \quad Y_0 = x.$$

- ▶ $e^{\gamma V_0} f(x) = f(z(\gamma))$, with

$$\dot{z} = V_0(z), \quad z(0) = x.$$

- ▶ Advantage: Y_t can be much better approximated than X_t .
- ▶ For extrapolation to any order see Oshima, Teichmann and Velušček.

The Ninomiya-Victoir method

- ▶ On a (uniform) grid $0 = t_0 < \dots < t_n = T$ set $\Delta t_i := t_{i+1} - t_i$, $\Delta B_i^j := B_{t_{i+1}}^j - B_{t_i}^j$, Λ_i Bernoulli-distributed
- ▶ Set $\bar{X}_0 = x$ and iteratively

$$\bar{X}_{i+1} := \begin{cases} e^{\frac{\Delta t_i}{2} V_0} e^{\Delta B_i^d V_d} \dots e^{\Delta B_i^1 V_1} e^{\frac{\Delta t_i}{2} V_0} \bar{X}_i, & \Lambda_i = 1, \\ e^{\frac{\Delta t_i}{2} V_0} e^{\Delta B_i^1 V_1} \dots e^{\Delta B_i^d V_d} e^{\frac{\Delta t_i}{2} V_0} \bar{X}_i, & \Lambda_i = -1. \end{cases} \quad (3)$$

- ▶ $e^{sV_i} x := z(1)$, where $\dot{z}(t) = sV_i(z(t))$, $z(0) = x$
- ▶ Global error: $E[f(X_T)] - E[f(\bar{X}_n)] = O((\sup \Delta t_i)^2)$
- ▶ Interpretation as cubature method and splitting method

The Ninomiya-Victoir method

- ▶ On a (uniform) grid $0 = t_0 < \dots < t_n = T$ set $\Delta t_i := t_{i+1} - t_i$, $\Delta B_i^j := B_{t_{i+1}}^j - B_{t_i}^j$, Λ_i Bernoulli-distributed
- ▶ Set $\bar{X}_0 = x$ and iteratively

$$\bar{X}_{i+1} := \begin{cases} e^{\frac{\Delta t_i}{2} V_0} e^{\Delta B_i^d V_d} \dots e^{\Delta B_i^1 V_1} e^{\frac{\Delta t_i}{2} V_0} \bar{X}_i, & \Lambda_i = 1, \\ e^{\frac{\Delta t_i}{2} V_0} e^{\Delta B_i^1 V_1} \dots e^{\Delta B_i^d V_d} e^{\frac{\Delta t_i}{2} V_0} \bar{X}_i, & \Lambda_i = -1. \end{cases} \quad (3)$$

- ▶ $e^{sV_i} x := z(1)$, where $\dot{z}(t) = sV_i(z(t))$, $z(0) = x$
- ▶ Global error: $E[f(X_T)] - E[f(\bar{X}_n)] = O((\sup \Delta t_i)^2)$
- ▶ Interpretation as **cubature method** and splitting method

The Ninomiya-Victoir method

- ▶ On a (uniform) grid $0 = t_0 < \dots < t_n = T$ set $\Delta t_i := t_{i+1} - t_i$, $\Delta B_i^j := B_{t_{i+1}}^j - B_{t_i}^j$, Λ_i Bernoulli-distributed
- ▶ Set $\bar{X}_0 = x$ and iteratively

$$\bar{X}_{i+1} := \begin{cases} e^{\frac{\Delta t_i}{2} V_0} e^{\Delta B_i^d V_d} \dots e^{\Delta B_i^1 V_1} e^{\frac{\Delta t_i}{2} V_0} \bar{X}_i, & \Lambda_i = 1, \\ e^{\frac{\Delta t_i}{2} V_0} e^{\Delta B_i^1 V_1} \dots e^{\Delta B_i^d V_d} e^{\frac{\Delta t_i}{2} V_0} \bar{X}_i, & \Lambda_i = -1. \end{cases} \quad (3)$$

- ▶ $e^{sV_i} x := z(1)$, where $\dot{z}(t) = sV_i(z(t))$, $z(0) = x$
- ▶ Global error: $E[f(X_T)] - E[f(\bar{X}_n)] = \mathcal{O}((\sup \Delta t_i)^2)$
- ▶ Interpretation as cubature method and **splitting method**

$$Q_{\Delta t}^{NV} = \frac{1}{2} e^{\frac{\Delta t}{2} L_0} e^{\Delta t L_1} \dots e^{\Delta t L_d} e^{\frac{\Delta t}{2} L_0} + \frac{1}{2} e^{\frac{\Delta t}{2} L_0} e^{\Delta t L_d} \dots e^{\Delta t L_1} e^{\frac{\Delta t}{2} L_0},$$

where $L_0 f(x) = V_0 f(x)$, $L_i f(x) = \frac{1}{2} V_i^2 f(x)$,

$$Q_{\Delta t}^{NV} \approx P_{\Delta t} := e^{\Delta t L_0 + \Delta t \sum_{i=1}^d L_i}$$

ODEs for Ninomiya-Victoir

- ▶ Requires $\exp(sV_0), \exp(sV_1), \dots, \exp(sV_d)$
- ▶ Numerical solution of ODEs possible, see Ninomiya and Ninomiya.
- ▶ Experience suggests that explicit solutions preferable whenever available.
- ▶ Question: Which relevant models in mathematical finance allow for explicit formulas of all required terms $\exp(sV_0), \exp(sV_1), \dots, \exp(sV_d)$?
- ▶ Diffusion vector-fields V_1, \dots, V_d often simple enough, Stratonovich correction causing problems,

$$V_0(x) = V(x) - \frac{1}{2} \sum_{i=1}^d DV_i(x) \cdot V_i(x).$$

- ▶ Idea: move correction terms back to diffusion part.

ODEs for Ninomiya-Victoir

- ▶ Requires $\exp(sV_0), \exp(sV_1), \dots, \exp(sV_d)$
- ▶ Numerical solution of ODEs possible, see Ninomiya and Ninomiya.
- ▶ Experience suggests that explicit solutions preferable whenever available.
- ▶ **Question:** Which relevant models in mathematical finance allow for explicit formulas of all required terms $\exp(sV_0), \exp(sV_1), \dots, \exp(sV_d)$?
- ▶ Diffusion vector-fields V_1, \dots, V_d often simple enough, Stratonovich correction causing problems,

$$V_0(x) = V(x) - \frac{1}{2} \sum_{i=1}^d DV_i(x) \cdot V_i(x).$$

- ▶ Idea: move correction terms back to diffusion part.

ODEs for Ninomiya-Victoir

- ▶ Idea: move correction terms back to diffusion part.

Drift trick

Reformulation

$$dX_t = V_0^{(\gamma)}(X_t)dt + \sum_{i=1}^d V_i(X_t) \circ d(B_t^i + \gamma^i t),$$

where $V_0^{(\gamma)}(x) := V_0(x) - \sum_{i=1}^d V_i(x)\gamma^i$.

- ▶ Use Ninomiya-Victoir with V_0 replaced by $V_0^{(\gamma)}$ and ΔB^i replaced by $\Delta B^i + \gamma^i \Delta t$.
- ▶ Second order convergence retained.
- ▶ Cubature method also obvious.
- ▶ Non-standard splitting:

$$L = V_0 + \frac{1}{2} \sum_{i=1}^d V_i^2 = V_0^{(\gamma)} + \sum_{i=1}^d \left(\frac{1}{2} V_i^2 + \gamma^i V_i \right)$$

Girsanov transform

- ▶ Let $\mathcal{E}_t := \exp\left(\langle \gamma, B_t \rangle - \frac{1}{2} \|\gamma\|^2 t\right)$ and Q be defined by $\frac{dQ}{dP} = \mathcal{E}_T$.
- ▶ We have

$$E_P[f(X_T)] = E_Q[f(Y_T)] = E_P[f(Y_T)\mathcal{E}_T],$$

where Y_T solves the SDE with $V_0^{(\gamma)}, V_1, \dots, V_d$.

- ▶ But: $\text{Var}[\mathcal{E}_T] = e^{\|\gamma\|^2 T} - 1$.

Generalized SABR model

Model

$$dX_t^1 = a(X_t^2)^\alpha (X_t^1)^\beta dB_t^1,$$

$$dX_t^2 = \kappa(\theta - X_t^2)dt + bX_t^2(\rho dB_t^1 + \sqrt{1 - \rho^2}dB_t^2),$$

where $1/2 \leq \alpha, \beta \leq 1$. (SABR: $\alpha = 1, \kappa = 0$.)

$$e^{sV_1}x = \left(\frac{g_1(s, x)}{x^2 e^{b\rho s}} \right), \quad e^{sV_2}x = \left(\frac{x^1}{x^2 e^{b\sqrt{1-\rho^2}s}} \right),$$

$$g_1(s, x) = \begin{cases} \left[(1 - \beta) \frac{a(x^2)^\alpha}{\alpha b \rho} (e^{\alpha b \rho s} - 1) + (x^1)^{1-\beta} \right]_+^{1/(1-\beta)}, & \beta < 1, \\ x^1 \exp\left(\frac{a(x^2)^\alpha}{\alpha b \rho} (e^{\alpha b \rho s} - 1) \right), & \beta = 1. \end{cases}$$

Generalized SABR model – 2

- ▶ No explicit formula for $e^{SV_0}x$, where

$$V_0(x) = \left(\frac{-\frac{1}{2}a^2\beta(x^2)^{2\alpha}(x^1)^{2\beta-1} - \frac{1}{2}\alpha ab\rho(x^2)^\alpha(x^1)^\beta}{\kappa\theta - \left(\kappa + \frac{1}{2}b^2\right)x^2} \right)$$

- ▶ **Drift trick:** choose $\gamma \in \mathbb{R}^d$, set $V_0^{(\gamma)}(x) := V_0(x) - \sum_{i=1}^d \gamma^i V_i(x)$ and consider

$$dX_t = V_0^{(\gamma)}(X_t)dt + \sum_{i=1}^d V_i(X_t) \circ d(B_t^i + \gamma^i t)$$

Generalized SABR model – 2

- ▶ No explicit formula for $e^{SV_0}x$, where

$$V_0(x) = \left(\begin{array}{c} -\frac{1}{2}a^2\beta(x^2)^{2\alpha}(x^1)^{2\beta-1} - \frac{1}{2}\alpha ab\rho(x^2)^\alpha(x^1)^\beta \\ \kappa\theta - \left(\kappa + \frac{1}{2}b^2\right)x^2 \end{array} \right)$$

- ▶ **Drift trick:** choose $\gamma \in \mathbb{R}^d$, set $V_0^{(\gamma)}(x) := V_0(x) - \sum_{i=1}^d \gamma^i V_i(x)$ and consider

$$dX_t = V_0^{(\gamma)}(X_t)dt + \sum_{i=1}^d V_i(X_t) \circ d(B_t^i + \gamma^i t)$$

Generalized SABR model – 3

- ▶ Choose $\gamma^1 = -\frac{1}{2}\alpha b\rho$, $\gamma^2 = \frac{\alpha b\rho^2 - 2\kappa/b - b}{2\sqrt{1-\rho^2}}$ to obtain

$$V_0^{(\gamma)}(x) = \left(\begin{array}{c} -\frac{1}{2}a^2\beta(x^2)^{2\alpha}(x^1)^{2\beta-1} \\ \kappa\theta \end{array} \right)$$

- ▶ Explicit solution: $e^{sV_0^{(\gamma)}} x = (g_0(s, x), \kappa\theta s + x^2)$, with

$$g_0(s, x) = \begin{cases} \left[-\theta^2\beta(1-\beta)P(s, x) + (x^1)^{2(1-\beta)} \right]_+^{1/2(1-\beta)}, & \beta < 1, \\ x^1 \exp\left(-\frac{1}{2}a^2P(s, x)\right), & \beta = 1, \end{cases}$$

$$P(s, x) = \frac{1}{(2\alpha + 1)\kappa\theta} \left((\kappa\theta s + x^2)^{2\alpha+1} - (x^2)^{2\alpha+1} \right)$$

Generalized SABR model – 3

- ▶ Choose $\gamma^1 = -\frac{1}{2}\alpha b\rho$, $\gamma^2 = \frac{\alpha b\rho^2 - 2\kappa/b - b}{2\sqrt{1-\rho^2}}$ to obtain

$$V_0^{(\gamma)}(x) = \left(\begin{array}{c} -\frac{1}{2}a^2\beta(x^2)^{2\alpha}(x^1)^{2\beta-1} \\ \kappa\theta \end{array} \right)$$

- ▶ Explicit solution: $e^{sV_0^{(\gamma)}} x = (g_0(s, x), \kappa\theta s + x^2)$, with

$$g_0(s, x) = \begin{cases} \left[-\theta^2\beta(1-\beta)P(s, x) + (x^1)^{2(1-\beta)} \right]_+^{1/2(1-\beta)}, & \beta < 1, \\ x^1 \exp\left(-\frac{1}{2}a^2P(s, x)\right), & \beta = 1, \end{cases}$$

$$P(s, x) = \frac{1}{(2\alpha + 1)\kappa\theta} \left((\kappa\theta s + x^2)^{2\alpha+1} - (x^2)^{2\alpha+1} \right)$$

Generalized SABR – Numerical experiment

Generalized SABR – Computational time

Method	n	M	Rel. Error	Time

Ninomiya-Victoir	4	2048000	0.00204	13.93 sec
NV with drift	4	1024000	0.00104	2.88 sec

Multi-dimensional generalized SABR

Model

$$dX_i(t) = a_i Y_i(t)^{\alpha_i} X_i(t)^{\beta_i} d\tilde{B}_t^i$$

$$dY_i(t) = \kappa_i(\theta_i - Y_i(t))dt + b_i Y_i(t)d\tilde{W}_t^i$$

\tilde{B} and \tilde{W} correlated Brownian motions.

- ▶ Drift trick allows solving all ODEs explicitly provided that the correlation matrix has full rank.
- ▶ Here we use 4 assets, i.e., dimension $N = 8$, $d = 8$.

Method	n	M	Rel. Error	Time
Euler	32	2048000	0.000934	246.65 sec
Ninomiya-Victoir	4	1024000	0.002017	52.33 sec
NV with drift	4	1024000	0.000862	35.31 sec

Multi-dimensional Generalized SABR

Further examples

- ▶ More stochastic volatility models qualify:
 - ▶ Molina, Han and Fouque
 - ▶ Trolle and Schwartz (time-homogeneous version)
- ▶ Gatheral's (Bühler's) double mean reverting stochastic volatility model does not fall into this class.
